

GEOProcessing 2010 Panel

Digital Society Trends: Geospatial Processing Challenges

Moderator: Bernd Resch, MIT and Research Studios Austria, USA/Austria

Panelists:

Jean-Yves Delort, Macquarie University, Australia

Qifeng Lu, Center for Geospatial Information Technology, Virginia Tech, USA

Carlos Granell, Universitat Jaume I, Spain

Bernd Resch, MIT and Research Studios Austria, USA/Austria

Victor Lobo, Portuguese Naval Academy / New University of Lisbon, Portugal

Research Challenges

A “never ending quest” :

- Knowledge from data
 - A lot of data
 - Bad data
 - “Drowned in data, Starving for knowledge”
 - We need better (true) geospatial datamining

Research Challenges

A challenge that we should have achieved:

- 4D GIS for the masses:
 - Efficient visualization & interaction
 - True 4D analysis tools

4D: An old concept

- Torsten Hägerstrand, 1969
 - Time Geography, time-space paths
- 4D GIS proposals have been around since the beginning of the 90'
 - Database technologies are “ok”.
 - Visualization techniques are available...
 - Not quite “ok”...
 - 2.5D is the norm. Others are clumsy...
 - Any true and usable 4D ?
 - Analysis techniques are available...
 - Not quite “ok” ...or are they ?
 - Time and space should NOT be treated as other variables: they have their own particular characteristics

The need exists

- Automobile GPS systems
 - Why 4D ? (or at least time-space)
 - Traffic jams, circulation restrictions, energy consumption concerns, etc
- Maritime navigation systems
 - Meteorological and oceanographic data (tides, storms, shallow channels, etc,,)

4D GIS – Pervasive Sensing – Linked Data

Future Challenges in GIS

Bernd Resch

MIT
senseable city lab:::

4D GIS

- How can 4D be brought to the user?
- What are different ways of representing the time dimension instead of time itself?
- New paradigms (approaches, methods, algorithms) necessary in spatio-temporal analysis

Pervasive Sensing

- Bottom-up vs. top-down approach in policy-making
 - Central criterion for user adoption: usefulness
 - Privacy protection: opt-in/opt-out possibilities
- ➔ but: adapt our perception to new technologies instead of preventing innovation!

Linked Data

- Why are geo-data often not linked and how can this problem be solved?
- Are dedicated linkages between geo-data sources even necessary or is the implicit location link sufficient?
- Why are other domains obviously far ahead?

Model Web and Linked Data

Carlos Granell, UJI, Spain

Panel on Geoprocessing challenges
GEOProcessing 2010 Conference, Feb 2010

Models everywhere

Pervasive Sensing

**A Multi-dimensional Challenge in the Stress Field
Technology – Innovation – Society**

Bernd Resch

14 February 2010

senseable city lab:::

Pervasive Sensing ::: Vision

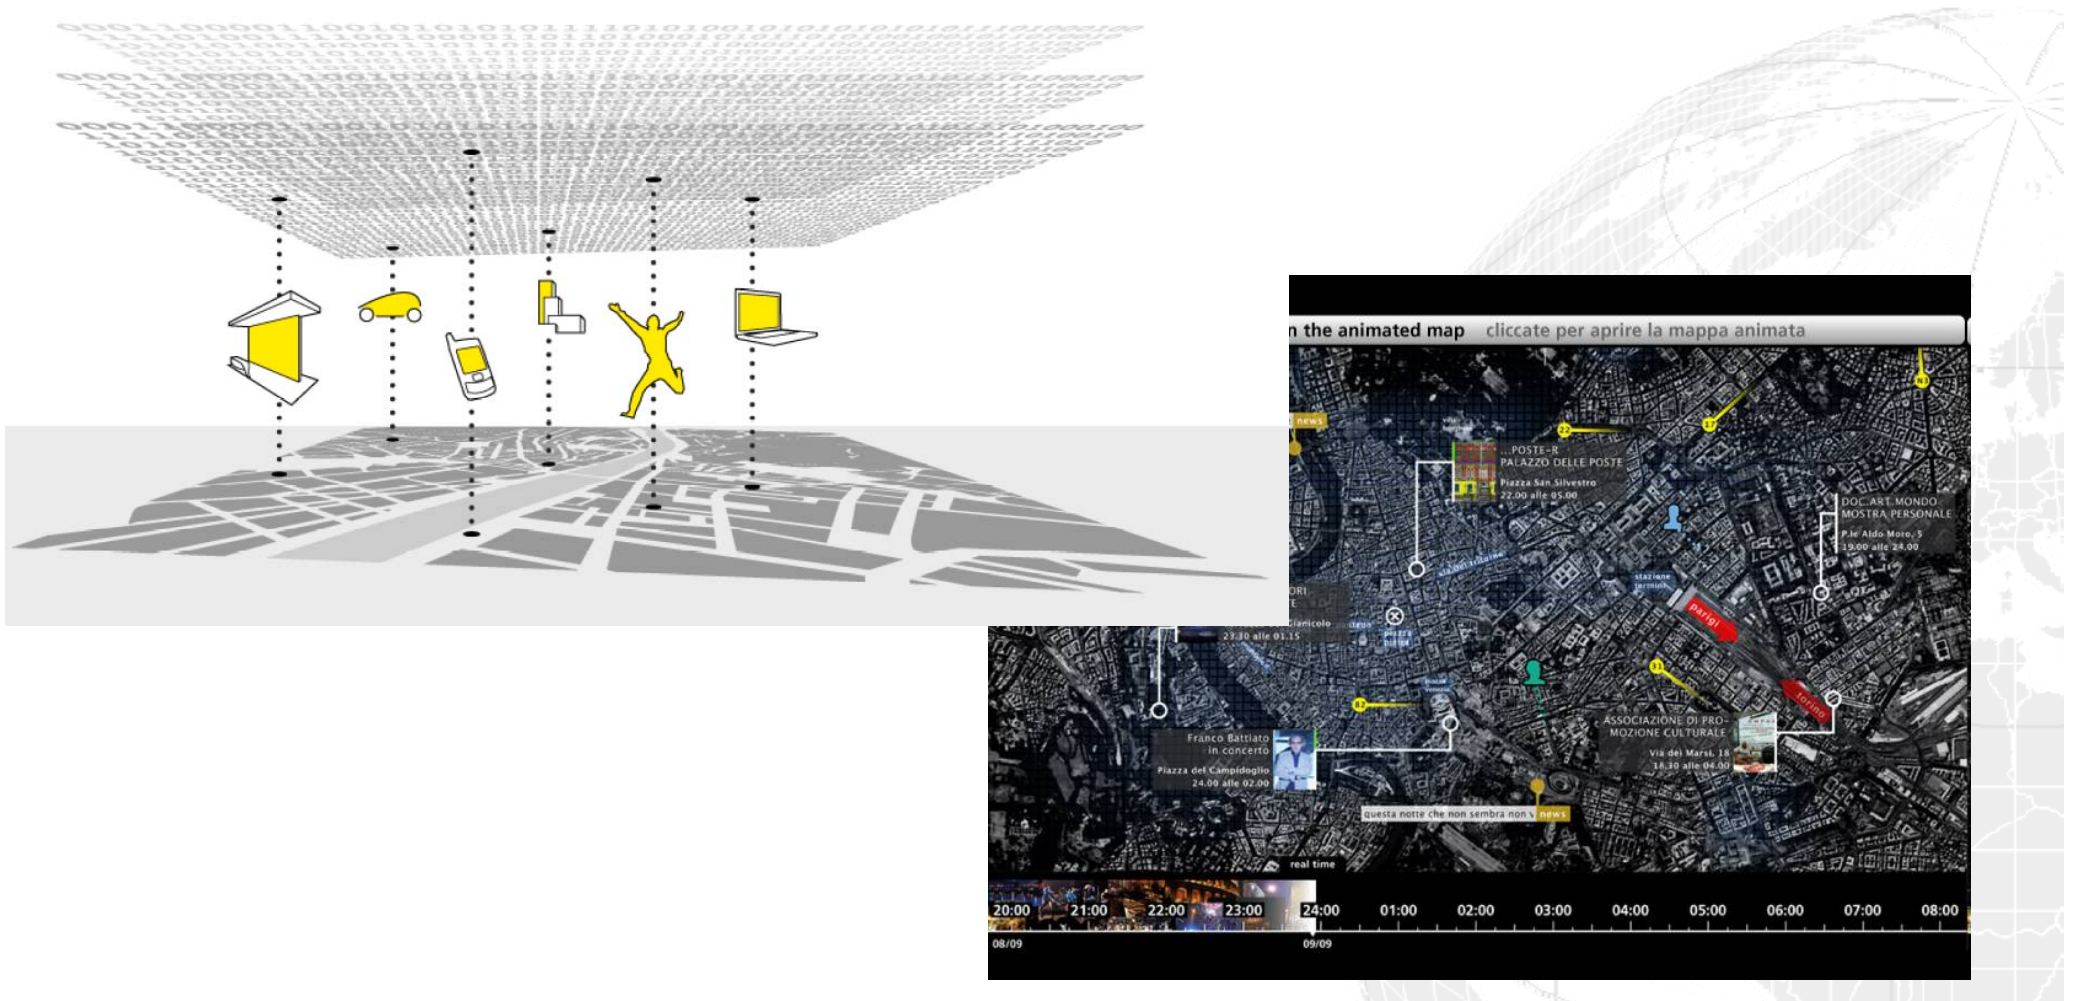

- “In the next century, **planet earth will don an electronic skin**. It will use the Internet as a scaffold to support and transmit its sensations. [...] It consists of millions of **embedded electronic measuring devices**: thermostats, pressure gauges, pollution detectors, cameras, microphones, glucose sensors, EKGs, electroencephalographs. These will probe and **monitor cities** and endangered species, the atmosphere, our ships, highways and fleets of trucks, our conversations, our bodies – even our dreams.”

(Neil Gross, 1999)

Pervasive Sensing ::: Motivation

- Ubiquitous monitoring is a critical process:
 - ◆ Ensure public safety
 - ◆ Set up continuous information services
 - ◆ Provide input for spatial decision support systems
- ➔ Shift development away from proprietary single-purpose implementations towards interoperable analysis systems

Pervasive Sensing ::: Motivation

Pervasive Sensing ::: Essential Questions

- What are particular challenges of pervasive sensing and monitoring?
- Which implications does “pervasive urban monitoring” contain for the individual?
- What societal, technological and perceptual impacts do pervasive monitoring infrastructures have on our environment?

Particular Challenges of Pervasive Sensing

- Conceptual
 - ◆ Various stakeholders
 - ◆ Large variations within continuous physical phenomena
 - ◆ Direct impact on people
- Technical

Effects on the Social/Urban Environment

- Support professionals in building or refining their models of urban dynamics
- Trigger profound rethinking process in collaboration and cooperation efforts between different authorities

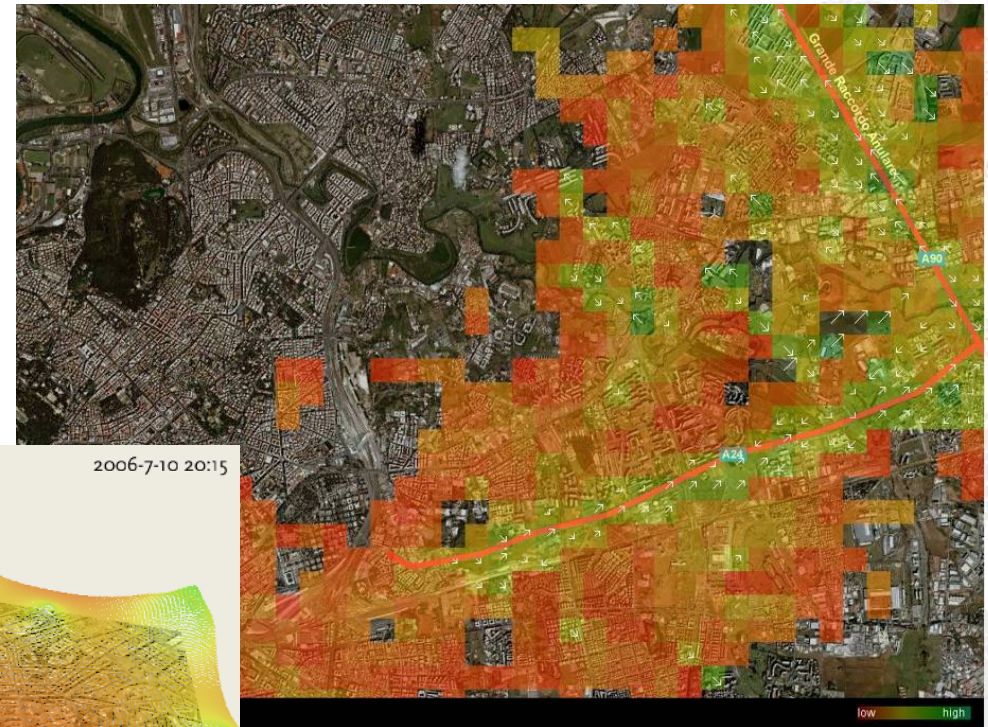

Effects on the Social/Urban Environment

- Feed back “sensed” data can change people’s behaviour
- Empower everyday citizens to monitor the environment with sensor-enabled mobile devices
- People-centric view of measuring, sharing, and discussing urban environments might increase agencies’ and decision makers’ understanding of a community’s claims

Effects on the Social/Urban Environment

- Issues:
 - ◆ Sensor data are just surrogates for other, more direct impacts on humans
 - ◆ Privacy, data ownership, accessibility and integrity
 - ◆ Sampling density, standardisation, quality control, power control, officiality of data, and update frequency

Effects on the Social/Urban Environment

Conclusion

- Address the discussion in a constructive way and bring the technology to the people!
 - Promote the user appropriation of the information through awareness of limitations
- ➔ **usefulness is the key**
