

The Eighth Advanced International Conference  
on Telecommunications (AICT 2012)

May 27 - June 1, 2012 - Stuttgart, Germany

## Communication Challenges for the Next Generation Power Grid

Harald Gjermundrod  
Assistant Professor

UNIVERSITY OF NICOSIA

### Overview

- ▶ Electric power Grid part of a states **critical infrastructure**
- ▶ Our **modern life depends** on the availability of **reliable, resilient, stable, and cheap** electricity
- ▶ Currently generate electricity is **generated** by large installation using **non-renewable fossil or nuclear based** fuels
- ▶ According to the International Energy Agency (IEA) [4]
  - ▶ Currently **70%** of the electricity is produced from **fossil fuels** responsible for **40%** of the **global CO<sub>2</sub> emission**
  - ▶ If energy related CO<sub>2</sub> emissions are reduced by 50% before 2050
    - ▶ Demand expected to increase by 115% until 2050
  - ▶ Else
    - ▶ Demand expected to increase by 150% until 2050

### Overview (Cont.)

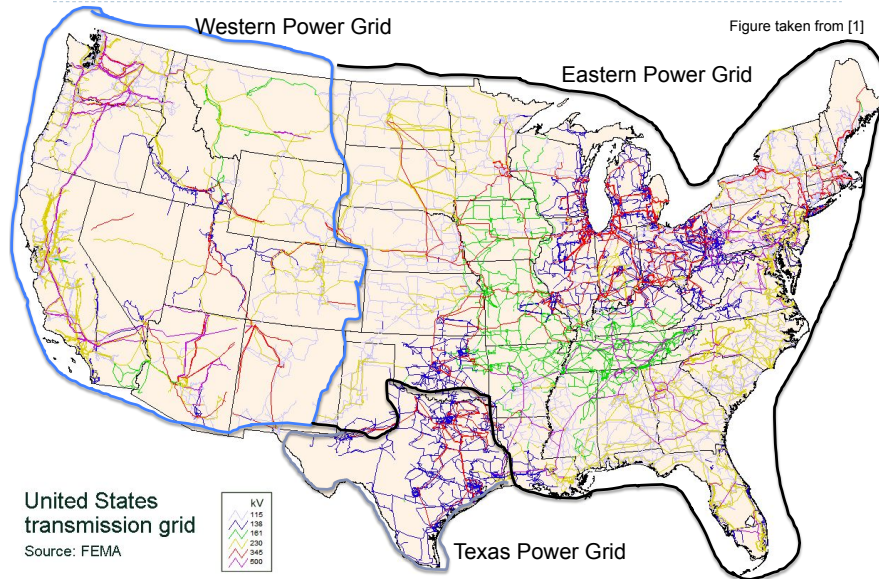

## The big question

**How to support the growing demand of reliable electricity while at the same time reduce the reliance on non-renewable pollutant and/or dangerous fuels**

▶ 4

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

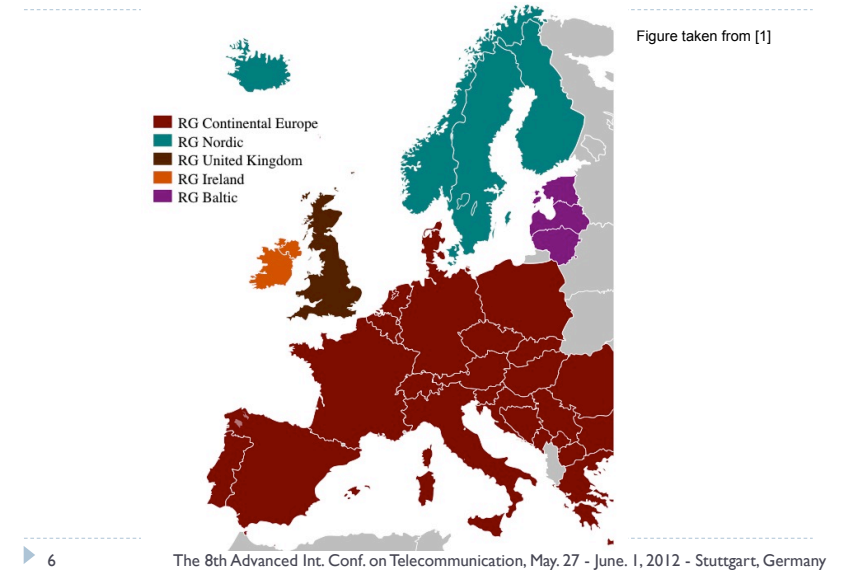

## Overview - US Electric Power Grids

## Talk Outline

- ▶ Overview

- ▶ Talk Summary

## Overview - European Power Grids

## Background - Requirements

- ▶ Electric Power Grid requirements
  - ▶ Electricity must be transported from the large power plants to the consumers
    - ▶ Electricity cannot currently be stored
  - ▶ The whole Grid operates as one large system at the same frequency.
  - ▶ Demand must be matched by Supply in real time
    - ▶ Too much demand, the frequency drops
    - ▶ Too much supply, the frequency increases
    - ▶ Suppliers must be able to provide Peak-Demand when needed
  - ▶ System should be able to handle
    - ▶ Temporary loss if power generators
    - ▶ Lose of power lines
    - ▶ Various equipment failures

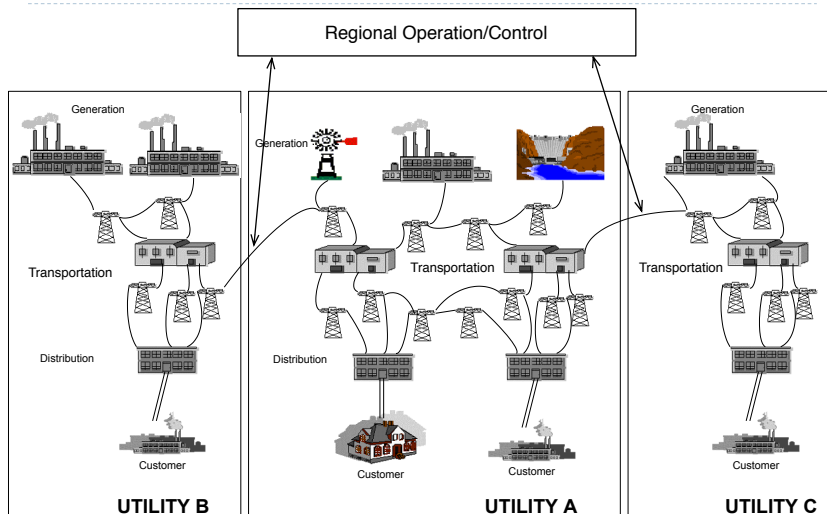

## Background - Failures

- ▶ **Blackouts in the US**
  - ▶ 5 major blackouts in the last 40 years
  - ▶ 3 occurred in the last decade
  - ▶ The 2003 North Eastern [2] blackout was mainly due to
    - ▶ One sagging transmission line
    - ▶ One faulty alarm due to a race condition in the software
    - ▶ Lack of situation awareness of the operators
  - ▶ Affected about 55 million people in Canada and the US and loss of an estimated \$7 – 10 billion
- ▶ **Blackout in Cyprus [3]**
  - ▶ One major power plant supplied 47% of the republics needs
  - ▶ On July 11th 2011, explosion at the nearby navel base destroyed the plant.

## Background – Power Grids

- ▶ **Traditional Power Grids (Vertically Integrated Electric Utility)**
  - ▶ Each region (part of a Grid) is owned and operated by one utility (company/organization)
  - ▶ Each utility responsible for the entire chain
    - ▶ Generation
    - ▶ Transportation/Distribution
    - ▶ Consumption
  - ▶ Collaboration between the utilities through some hierarchy of independent organization/operators.
    - ▶ In the US:
      - Regional Transmission Organization (between states)
      - Independent System Operator (within a state)
    - ▶ In the EU
      - European Network of Transmission System Operators for Electricity
      - Transmission System Operators (within a state)

## Background – Power Grids (Cont.)

## Background – Power Grids (Cont.)

- ▶ Each **Power Grid** have their own **behavior** and **controllability** determined by
  - ▶ **Distance** from generation to consumption
  - ▶ Number and **size** of generators, i.e. a few big generators or many smaller generators
  - ▶ **Type** of generators: Time needed to start and stop the generators
  - ▶ **Predictability** of the consumption, i.e. few big consumers or many residential homes
  - ▶ **Seasonal changes** in the area for predictability of the load
- ▶ **One solution may not fit all**
- ▶ Best practices and solutions must be converted/amended/modified before applied

## Background – Changing Landscape

- ▶ **Aging infrastructure** (part if it more then 40 years.)
- ▶ **Higher demand** for power transmission – miles x megawatts
  - ▶ More power and longer distances with little new transmission
  - ▶ Charging of **Electric Vehicle** in the future
- ▶ **Deregulation of the industry**
  - ▶ **More participants** whose actions affect grid stability
- ▶ **Technology in recent years is adding**
  - ▶ Many more “**intelligent**” devices
  - ▶ Much more **heterogeneity**
- ▶ **Protection and control is mostly local today**
  - ▶ Remedial Action Schemes (RAS): hardwired remote link to trigger a protective relay
  - ▶ Otherwise almost exclusively local monitoring (status) & local control
    - ▶ **Power dynamics are grid wide**, and **anomalies** can affect a wide geographic area

## Talk Outline

- ▶ **Overview**
- ▶ **Background**
- ▶ **Smart Grid**
  - ▶ Definition
  - ▶ Expectations
  - ▶ Transition: Past, Present, Future
  - ▶ Multidisciplinary Challenges
- ▶ **Information and Communications Technology**
  - ▶ Needs
  - ▶ Telecommunication
  - ▶ Information Technology
- ▶ **Research Examples & Standardization Efforts**
  - ▶ GridStat Framework
  - ▶ Inspire Project
  - ▶ International Collaboration & Standardization
- ▶ **Talk Summary**

## Smart Grid – Definition

- ▶ The concept of **Smart Grid** have been refereed to as **Advanced Metering** at the Consumer End, but its much broader then that
- ▶ Its broader definition is twofold:
  - ▶ “**Smart grid** is an **electricity network** that uses **digital** and other **advanced technologies** to **monitor** and **manage** the transport of electricity from **all generation sources** to **meet** the **varying electricity demands** of **end-users**.”
  - ▶ “**Smart grids co-ordinate** the **needs** and **capabilities** of all **generators, grid operators, end-users** and electricity **market stakeholders** to operate all parts of the system as **efficiently** as possible, **minimizing costs** and **environmental impacts** while **maximizing** system **reliability, resilience** and **stability**.”

## Smart Grid – Definition (Cont.)

- ▶ Wikipedia has the following definition

“A **smart grid** is a **digitally enabled electrical grid** that gathers, distributes, and acts on information about the behavior of all participants (**suppliers and consumers**) in order to improve the **efficiency, importance, reliability, economics, and sustainability** of electricity services.”

## Smart Grid – Definition (Cont.)

- ▶ Depending on the state of the Grid the **smartening** of the Grid will be **different**
- ▶ For **Industrialized** and **Economies in Transition Countries**
  - ▶ The Smart Grid will be an **evolutionary** process, not a one-time event
  - ▶ Sunk cost in legacy systems will result in their usage until decommissioning
- ▶ For **Developing** countries
  - ▶ Can **take advantage** of the new technologies as the **countries infrastructure** is developed.

▶ 17

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Smart Grid – Expectations

- ▶ Some of the **expectation** of a **Smart Grid**
  - ▶ **Large portion** of the electricity **generated** from **renewable sources**
    - ▶ Hydro, wind, photovoltaic, tidal technologies, combined heat and power, or future technology
  - ▶ Operate the Grid more **efficiently**
    - ▶ Reduce the Peak-demand, i.e. flatten the usage curve
    - ▶ Quicker reaction time due to more measuring devices leading to greater situation awareness
  - ▶ **Automated management**
    - ▶ More intelligent management of the Grid.
  - ▶ **Prosumer**:
    - ▶ **Consumers** may also become **producers**, i.e. small wind mills, photovoltaic, reverse EV (Electric Vehicle) charging.

▶ 18

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Smart Grid – Expectations (Cont.)

- ▶ **Demand-Side Management**:
  - ▶ Due to **less predictable** generation **management** must be shifted from **Supply** side towards **Demand** side
- ▶ **Reducing Peak Load** will make the Grid more **efficient**
  - ▶ **Intelligent devices** like: dryers, freezers, air conditions can switch off during peak demand
  - ▶ **Customers** can be informed about current pricing and may choose to **change routines** to minimize electricity use during **peak hours**

▶ 19

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Smart Grid – Transition

- ▶ **Smart Grid** from the **consumers** point of view
  - ▶ More flexibility and control, but more technological complex for the end user.
  - ▶ Analogy of change: Old analog telephones to today's Smart Phones

▶ 20

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Smart Grid – Past

- ▶ Transition from the power industry point of view
- ▶ Management done with few instrumentation points and communication between regions done through the Phone system
- ▶ During 2003 blackout, Regional operators still communicated through the phone system

Figure taken from [4]

▶ 21

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Smart Grid – Present

- ▶ Management still done at the supply side
- ▶ More instruments:
  - ▶ Phasor Measurement Units (PMU)
  - ▶ Supervisory Control and Data Acquisition (SCADA)
- ▶ More automated control, but still with relative large time intervals.
  - ▶ Every 5 minutes
  - ▶ Every 30 seconds

Figure taken from [4]

▶ 22

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Smart Grid – Future

- ▶ Many more:
  - ▶ Devices
  - ▶ point of control
  - ▶ participants
- ▶ All involved in operating the Grid
- ▶ Much more exchange of information is required

Figure taken from [4]

▶ 23

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Smart Grid – Multidisciplinary Challenges

- ▶ Power System Engineering
  - ▶ Must operate a reliable, stable, and resilient 'smart' power grid
- ▶ Telecommunication
  - ▶ The new 'Smart' is due to digital devices that must communication.
  - ▶ Must operate a reliable, stable, and resilient communication infrastructure
    - ▶ Should this be a dedicated infrastructure for the Critical Infrastructures?
- ▶ IT - Covers the whole stack
  - ▶ Network layer
  - ▶ Middleware layer
  - ▶ Application layer
- ▶ Business
  - ▶ How will power be traded in the Smart grid
  - ▶ More importantly: How will it be regulated?

▶ 24

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Talk Outline

---

- ▶ Overview
- ▶ Background
- ▶ Smart Grid
- ▶ Information and Communications Technology
  - ▶ Needs
  - ▶ Telecommunication
  - ▶ Information Technology
- ▶ Research Examples & Standardization Efforts
  - ▶ GridStat Framework
  - ▶ Inspire Project
  - ▶ International Collaboration & Standardization
- ▶ Talk Summary

---

▶ 25 The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Telecommunication

---

- ▶ The **physical layer** of the Communication Infrastructure
- ▶ Some **options** for the telecommunication infrastructure
  - ▶ **Dedicated** telecommunication infrastructure for the Critical Infrastructures.
  - ▶ **Piecemeal** of different systems for different purposes
  - ▶ **Share infrastructure** with other application areas such as the phone and/or Internet
  - ▶ **Hybrid** part of it is using dedicated a infrastructure while parts are using shared infrastructures like the Internet

---

▶ 27 The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Information and Communications Technology

---

- ▶ The **changing landscape** for the Grid
  - ▶ Many **more entities** that need **two-way** communication
  - ▶ Many **more generators**, but their availability is **not deterministic**
  - ▶ Introduction the **flexibility to store electricity**
  - ▶ Greater **flexibility** of **end user** to “**plan**” their electricity usage
  - ▶ Introduction of a “**market**” to **trade electricity**
- ▶ All of this **exchange of information** will rely on a future ICT infrastructure

---

▶ 26 The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Telecommunication – Dedicated Infrastructure

---

- ▶ Dedicated infrastructure with **complete separation** from other networks
  - ▶ **Shared** with all the participants in the Smart Grid
  - ▶ Possible more **predictability** and **controllable** than other solutions
  - ▶ Need to differentiate traffic and provide **different QoS**
  - ▶ Many participants will have access which can **complicate security** issues
- ▶ **Compartmentalized and/or Virtualized** dedicated infrastructure
  - ▶ The **control and monitoring** with stringent QoS requirements are compartmentalized/Virtualized from the **information system** that could be offered different QoS guarantees
- ▶ **Most expensive** solution, but have some clear advantages

---

▶ 28 The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Telecommunication – Piecemeal of systems

- ▶ Current practice today
- ▶ **Different** infrastructure and systems for
  - ▶ different regions, utilities, and vendors use different systems
  - ▶ control and monitoring of critical component
  - ▶ various non-critical information systems
  - ▶ smart metering, power trading
- ▶ **Pros:**
  - ▶ **Clear separation** between the systems, could help with protection and security
  - ▶ Greater **predictability** with respect to systems usage (but this could change)
- ▶ **Cons:**
  - ▶ **Scalability:** Does not scale well.
  - ▶ **Flexibility:** How will new systems be added and to what part of the system
  - ▶ **Extensibility:** Will become a patchwork if the 'smartness' of the Grid is added to existing systems some of which is more than 20+ years old

▶ 29

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Telecommunication – Shared Infrastructure

- ▶ **Must keep in mind** that this is for a states **Critical Infrastructure**
  - ▶ A shared infrastructure have potentially **more vulnerabilities**
  - ▶ Who will have priority when **resources are limited**
  - ▶ For control systems with stringent latency requirements it has been shown that the TCP/IP protocol is not adequate
    - ▶ Small part of the control will have to use a dedicated infrastructure
- ▶ **Part of the non-critical information** could be exchange using infrastructures like the Internet
  - ▶ End users smart meters
  - ▶ Power buyers and sellers
  - ▶ Dissemination of predicted future prices, usages, etc.

▶ 30

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Telecommunication – Hybrid

- ▶ Slow **convergence** from current practice to a generic **dedicated infrastructure**
- ▶ Will **keep** the **current system running**, while upgrading to a universal dedicate infrastructure.
- ▶ **Cost will be a factor**
  - ▶ In the construction business it is cheaper to tear down a hotel and build a new one instead of upgrading the old

Figure taken from:  
<http://www.techblog.com/index.php/tech-gadget/spaghetti-cabling-cable-management-gone-wrong>

▶ 31

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Telecommunication – Summary

- ▶ **Whatever is chosen**
  - ▶ It should be **extensible** as it should have a very long lifetime.
    - ▶ Large investment that must be amortized over time
  - ▶ Should be **scalable**
    - ▶ Hybrid Vehicle Charging stations
    - ▶ New electricity generation technology
  - ▶ It should **follow standards** as to be interoperable and avoid vendor lock in
    - ▶ Competition and the use of COTS components will drive costs down
  - ▶ **Security and Protection**
    - ▶ Resilient to both physical and cyber-attacks
    - ▶ The Smart Grid will not operate without the telecommunication infrastructure, there should be no weak links

▶ 32

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Information Technology

- ▶ **Trusted Dissemination** of information with strong **QoS** requirements
  - ▶ All entities must exchange information
  - ▶ The **right information** must be **securely delivered** to **the right end-point** at the **right time** with a **high confidence** that it is indeed the **right information**.
- ▶ **Distributed Intelligence**
  - ▶ The smart Grid will need intelligence, i.e. Artificial Intelligence, to operate
  - ▶ Should **automatically operate** the Grid more **reliably, securely, and efficiently** than today.
  - ▶ How much **control** can/should we give up?
  - ▶ Who is **accountable** when unforeseen conditions/events occur?

▶ 33

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Information Technology – Network Layer

- ▶ Must provide **QoS classes** subject to the payload
  - ▶ **Predictability**
    - ▶ Predictable hop and routing latency
  - ▶ **Reliability**
    - ▶ Redundancy with heterogeneous technology
      - Bug in firmware or vulnerability in the hardware design
    - ▶ Should also have their own backup power source
      - If the power Grid fails then we don't want the control system to fail as well
  - ▶ **Adaptability**
    - ▶ Murphy's law will always apply
    - ▶ What to do when it happens
  - ▶ **Security**
    - ▶ Integrity, confidentiality, source authentication

▶ 34

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Information Technology – Network Layer (Cont.)

- ▶ Two recent trends may be looked at
  - ▶ **Peer-to-peer** Overlay Networks
    - ▶ Pro: Scalable, decentralized, and robust
    - ▶ Cons: Unpredictability, i.e. often best effort
  - ▶ Hardware **Virtualization**
    - ▶ Used to maximize the resources of servers
    - ▶ Provides for flexibility and compartmentalization of services
- ▶ **Potential for Virtualization of Networks**
  - ▶ Provide great **flexibility** if the Physical Network Infrastructure can be **virtualized**
  - ▶ Different systems will be given **dedicated virtual resources** with different **QoS guarantees**

▶ 35

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Information Technology – Middleware Layer

- ▶ **Middleware**
  - ▶ A layer above the **OS/Network** and below the Application
  - ▶ Masks **heterogeneity** and provides **higher abstractions**
- ▶ **End-to-end QoS**
  - ▶ Taking advantage of the **semantic** of the information to be disseminated
    - ▶ **Routing** can be done at the **middleware level**
    - ▶ Can also be done in hardware with Network Processors
  - ▶ **Per-flow state** can be maintained in the dissemination network to provide End-to-End QoS
    - ▶ Possibility for **multicast** if enough is know of the information flows

▶ 36

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Information Technology – Middleware Layer (Cont.)

- ▶ **Adaptability**
  - ▶ If routing/forwarding is done at middleware layer, mechanisms can be provided to **adapt** the **dissemination flows**
  - ▶ **Policies** at the **application layer** can be specified to use these mechanisms
- ▶ **Future Extensions**
  - ▶ Provide new **functionality** and **service** at the **middleware layer**, no need to change the underlying hardware infrastructure
  - ▶ Changes to the **underlying infrastructure** can be **masked** by the middleware layer

▶ 37

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Information Technology – Application Layer

- ▶ **Monitoring and Control**
  - ▶ EIOC: Electricity Infrastructure Operations Center at PNNL
  - ▶ Automatic response, but also Human-in-the-loop

Figure taken from [6]

▶ 38

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Information Technology – Application Layer (Cont.)

- ▶ **Monitoring and Control**
  - ▶ **Situation awareness**: Global Snap-shot of the state of the Grid
  - ▶ Run **simulations** for **State Estimation** and **Contingency Analysis** in real time.
    - ▶ Today High-performance Computing is needed to do this
    - ▶ What will be needed with a more **unpredictable power supply**?
  - ▶ With all the new devices and unpredictable power sources the stability and contingency analysis is greatly complicated
    - ▶ The need for **distributed intelligence**

▶ 39

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Information Technology – Application Layer (Cont.)

- ▶ **Distributed Intelligence**
  - ▶ Distributed stability and contingency analysis must run **in real time**.
    - ▶ The dissemination infrastructure is of paramount importance
  - ▶ May **not** be possible to get an **prediction** of the **stability** of the Grid
    - ▶ Incomplete information about certain part of the Grid.
    - ▶ No way to know if it will be cloudy in the next 2 minutes
  - ▶ **Collective agreement** as to how to **react** in any given situation, like instability, lose of major generation, etc.
    - ▶ Many secondary problem here:
      - Who should get affected
      - Who will scarifies their profit for stability
      - Many different trade-offs with parties with competing interests
    - ▶ The technical mechanisms can be distributed voting algorithms etc.
    - ▶ But how will the policy be regulated?

▶ 40

The 8th Advanced Int. Conf. on Telecommunication, May. 27 - June. 1, 2012 - Stuttgart, Germany

## Information Technology – Application Layer (Cont.)

- ▶ **HCI: Human Computer Interaction**
  - ▶ The control centers
    - ▶ Will the **humans** be able to **keep up** in a Smart Grid?
    - ▶ Maybe the **machines** will need to be in **control** with a **safety kill-switch**
  - ▶ The end-users
    - ▶ Current state: “The electricity just works and is always there”
    - ▶ The idea of the smart grid is to provide the end users with **more flexibility** => might result in **more complexity**
    - ▶ Need a very **user friendly interface** if the user are supposed to “program”/“schedule” their appliances
    - ▶ Most end-user may just leave all their systems in the **default configuration**
      - Defying a major motivation for the Smart Grid

## Information Technology – Cyber Security

- ▶ **Perfect Security** is:
  - ▶ A system that is **turned off** and **disconnected** from all networks
  - ▶ **Not feasible** for the Smart Grid
- ▶ **Multiple threats** exists for the Smart Grid ICT infrastructure
  - ▶ More **participants** with legitimate reasons to receive and disseminate information
  - ▶ More **physical access points** to the control system, i.e. smart meters, prosumers, etc.
  - ▶ **Distributed intelligence** may be used to take control decision
    - ▶ This can be manipulated to take the wrong decisions

## Information Technology – Cyber Security (Cont.)

- ▶ **Denial Of Service attacks**
  - ▶ **More legitimate** entities in the loop
    - ▶ Can be used to start a DoS attack.
  - ▶ Possible to get various systems stuck in a “**thrashing**” state.
    - ▶ If EVs are used for storage of electricity, then a “thrashing” state could be to rapidly switch between using the EVs as consumers and produces.
  - ▶ The entities can **play the system** for monetary/competitive advantages
    - ▶ Need for strong regulatory oversight
- ▶ If the dissemination decisions are taken at the middleware layer, i.e. middleware layer routing
  - ▶ More **knowledge** available at the end-point to stop unwanted traffic

## Information Technology – Privacy Protection

- ▶ **Control** of large quantity of **information** is **Power**
- ▶ A Smart Grid needs **more information** from the consumers
  - ▶ Information is collected **when the consumer is consuming** electricity as to provide differentiated pricing schemes
  - ▶ If **consumers becomes produces**, much more information is collected
  - ▶ This information may also be **distributed** to “all” the other participants as it is needed for the **distributed intelligence algorithms**
- ▶ **Missus of information**
  - ▶ The collected information can be **mined** by **government agencies, utilities, and other consumers**
- ▶ **How will this ‘power’ be regulated**

## Talk Outline

- ▶ Overview
- ▶ Background
- ▶ Smart Grid
- ▶ Information and Communications Technology
- ▶ Research Examples & Standardization Efforts
  - ▶ GridStat Framework
  - ▶ Inspire Project
  - ▶ International Collaboration & Standardization
- ▶ Talk Summary

## GridStat Framework

- ▶ GridStat is a wide-area publish/subscribe middleware developed for disseminating streams of status information for the electric power grid
  - ▶ **Optimized** for the domain of **critical infrastructures** that makes it possible to take advantage of the semantics of the status info.
  - ▶ Convey status data in a **reliable, timely and secure manner** (QoS)
  - ▶ Provides end-to-end QoS guarantees
  - ▶ Also applicable to needs of other infrastructures: transportation, water, gas, etc.
- ▶ **Expects**
  - ▶ **Dedicated infrastructure**, completely controlled by GridStat
  - ▶ Needs this **to store per-flow information** in the forwarding engines
- ▶ **Appropriate for the control and protection system**

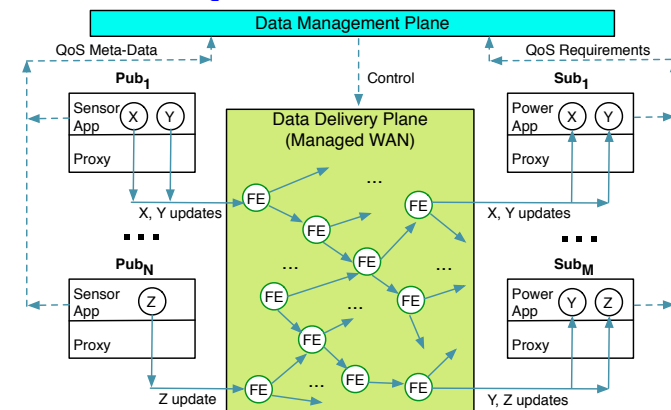

## GridStat is Publish-Subscribe Middleware

- ▶ **Publish-subscribe architecture**
  - ▶ Publish: periodically announce status values
  - ▶ Subscribe: periodically receive status values
- ▶ **Network of internal servers managed for QoS**
  - ▶ **Optimized for semantics** of status items
  - ▶ Provides **snap-shot** of a set of variables if they are published at the same time, i.e. **deterministic filtering of events**.
  - ▶ **Multicast** with of events that are to be delivered to multiple subscribers

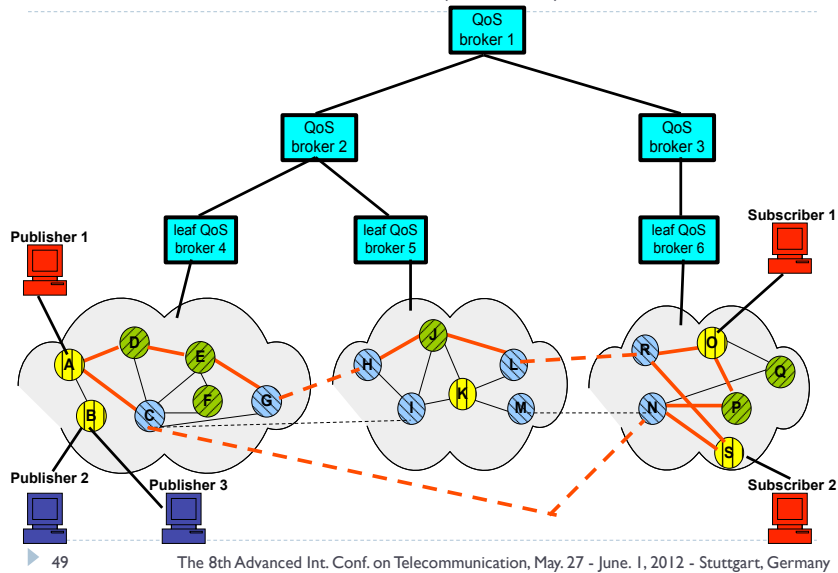

## GridStat Architecture

- ▶ **Management plane**: controls the resources in the data-plane
- ▶ **Data plane**: forwards events as efficiently as possible in order to provide **end-to-end QoS**

## GridStat Architecture (Cont.)

## Inspire

- ▶ **I**Ncreasing **S**ecurity and **P**rotection through **I**nfrastructure **R**esilience (**I**NSPIRE)
- ▶ **D**ata dissemination middleware with goal of providing high availability and data protection
- ▶ **I**nterconnections among SCADA systems can use COTS and public networks like the Internet.
  - ▶ Idea is to increasing the security and protection through infrastructure resilience
  - ▶ Using an P2P overlays as it
    - ▶ mask the heterogeneity of large scale topologies
    - ▶ provides robustness due to the redundancy of paths
    - ▶ provides data availability as data storage is replication on several nodes

## Inspire Architecture

- ▶ Easier to deploy than GridStat,
- ▶ Appropriate for less time sensitive control and management
  - ▶ Maybe the control and management system for the Prosumers

Figure taken from [7]

## International Collaboration & Standardization

- ▶ **I**ndustry and **G**overnment Initiatives
  - ▶ GridWise Alliance
  - ▶ North American SynchroPhasor Initiative (NASPI) Net
  - ▶ European Electricity Grids Initiative (EEGI)
  - ▶ European network for the Security of Control and Real-Time Systems (ESCoRTS)
- ▶ **G**overnment and **S**tandard **O**rganization
  - ▶ US: Energy Independence and Security Act (EISA) 2007
    - ▶ NIST Smart Grid Interoperability Standards Framework
  - ▶ EU: European Joint Working Group for Standardisation of Smart Grids
    - ▶ European Committee for Standardization (CEN)
    - ▶ European Committee for Electrotechnical Standardization (CENELEC)
    - ▶ European Telecommunications Standards Institute (ETSI)

## Talk Summary

---

- ▶ Smart Grid the dream
  - ▶ Can it deliver the dream of a **sustainable flow** of **renewable energy** to the World?
- ▶ Lots of **research possibility** from **everybody**
  - ▶ Engineering
    - ▶ Renewable energy fuels
    - ▶ Stable power delivery from unpredictable power generators
  - ▶ Information and Communications Technology
    - ▶ Trusted dissemination infrastructures
    - ▶ Distributed intelligent systems for operating the Smart Grid
  - ▶ Business
    - ▶ How to make a sustainable business model for the Smart Grid
  - ▶ Law
    - ▶ Privacy and regulatory needs
